

ECON7335: BYOP Final Project
Build your own problem set

In this project, you will work in a group of up to three students to build your own problem set covering the material from the course. The problem set should explore, extend, or build on the tools, papers, and ideas from the course. It should be distinct from, and cover different material than, the two problem sets I have already assigned. It may be purely analytical, or it may include a computational component. I will attempt your problem set, so it should also be feasible.

Groups. Please form your groups by the end of the third week of class. If you would like to be in a group and have not found one by that point, come see me and I will help you sort it out.

Due date. Friday, October 23 — two weeks after the last day of class.

Submission. Submit to Canvas as a PDF, along with any supporting code or documentation.

Deliverable. Your submission should include an unworked problem set and a separate solution key. Both documents must be typeset. This project is worth 50% of your course grade; the two problem sets are worth 25% each. I will grade you on the degree to which the problem set satisfies these criteria:

- The problem set poses clear and complete questions.
- The ordering of the sub-problems is conducive to understanding.
- The problem set introduces or builds on concepts from the course.
- The problem set is intellectually challenging.
- The problem set is feasible. (My measure of feasibility: could a classmate who has not seen your problem set complete it in ≈ 4 hours?)
- The solution key is complete, correct, and comprehensible.

If your problem set is exceptionally good, I may ask your permission to use it (with attribution) for future courses. I will never reproduce your work without your permission.
